

NETWORK-BASED TRANSLATION SYSTEM

ABSTRACT

The invention provides techniques for translation of written languages using a
5 network. A user captures the text of interest with a client device and transmits the image over
the network to a server. The server recovers the text from the image, generates a translation,
and transmits the translation over the network to the client device. The client device may
also support techniques for editing the image to retain the text of interest and excise
extraneous matter from the image.
